# Annex B. Technical information.

# NBC 1200 Air Filtration Unit

# **Preface**

#### **IMPORTANT NOTICE**

Prior to operation and maintennance to the installation it is essential to read and understand this manual.

Operation and maintenance to the installation **must** be carrier out by qualified personnel.

Van Halteren Special Products B.V. does not accept the responsibility of damage of the installation or other property or **injury to persons** due to failure to observe the proper procedures and instructions contained in this manual.

June 2019 R19-127 i

# Introduction

This manual is valid for the NBC 1200 unit as supplied by the manufacturer. The manufacturer accepts no liability for any damage resulting from incorrect use of the NBC 1200 unit, or resulting from modifications which have not been authorized by the manufacturer. The manufacturer also excepts no liability for damage, cause by malfunctioning of the NBC 1200 unit.

This manual gives relevant information for installation, operation and maintenance of the NBC 1200 unit.

The installation and maintenance instructions are only applicable for authorized, suitable trained, personnel.

Warranty conditions, as stated in the delivery documents, being in your possession, are valid for the NBC 1200 unit.

The warranty for the NBC 1200 unit is void when:

- · the unit is used for other purposes as described in this manual;
- · installation or maintenance is performed by unauthorized personnel;
- modifications to the unit have been carried out without written permission of Van Halteren Special Products B.V.;
- non-original components have been used for replacement.

# 1 Safety

This chapter provides instructions for a save installation, operation and maintenance of the NBC 1200 unit.

Keep this manual near the unit, as it is available at all times.

#### 1.1 General

For all work on the unit (transport, installation, operation and maintenance), the safety instructions of the manufacturer must be obeyed. This is also applicable for local regulations concerning prevention of accidents and protection of the environment.

# 1.2 Responsibility

The manufacturer is not responsible for damage or injury caused by ignoring the instructions in this manual or not complying to the safety regulations in this manual and to the local regulations.

# 1.3 Safety data sheets

Obey the actual safety instructions of the safety data sheets when you work with consumables (cleaning agents). These safety data sheets can be obtained by the manufacturer of the consumables.

# 1.4 Description of safety symbols

Notes, attention points and warnings will be shown in this manual, in the following way:

This symbol indicates a point of attention or a note, to give additional information.

This symbol indicates a general warning. The instruction must be obeyed to ensure a safe situation.

This symbol indicates a warning for electrical equipment. The instruction must be obeyed to ensure a safe situation.

# 1.5 Safety regulations

- Only use the NBC 1200 unit for applications mentioned in this manual.
- Remove the power from the NBC 1200 unit when you are going to work on electrical components inside of the NBC 1200 unit. Make sure the power cannot be switched on unintentionally.
- Operation of the NBC 1200 unit may only be performed by suitable trained personnel.
- Installation and maintenance of the unit may only be performed by authorized personnel.
- Take care when you work near the electrical heater element. This element can be hot, even when it is switched off.
- Use hoisting equipment with sufficient capacity to hoist the NBC 1200 unit. Refer to the technical specifications in chapter 3 for the weight of the unit.
- Obey the manufacturers safety instructions on the safety data sheet when you work with consumables.
- Do not use aggressive cleaning or abrasive agents to clean the NBC 1200 unit.
- Do not change the settings of the safety control devices. This can cause damage to the unit or injury to personnel.
- Do not disconnect or override the safety control devices. This can cause damage to the unit or injury to personnel.
- Make sure all filters are installed when the unit is used in combat situations.
- Be very careful when you replace the filters after an attack. The filters may contain harmful particles.

The HEPA part of the NBC filter only is monitored by the differential pressure indicator. The carbon part of the NBC filters could be saturated with contamination while the pressure drop is still less than 1600 Pa.

# 1.6 Safety provisions on the unit

The NBC 1200 unit is equipped with safety provisions which ensure a safe operation. The following provisions are available:

- A blast valve in the air inlet protects the unit against a pressure wave due to a hit.
- The electrical motor is protected against overload.
- The electrical heater is protected against overload.
- The unit generates an alarm and will not start when the NBC filters are not loaded and the unit is in NBC mode.

#### 1.7 Environment

Products which you dispose, may contain valuable materials. Contact the appropriate authority for possible re-use of the material or an environmental friendly disposal of the material.

# 2 Description of the NBC 1200 unit

#### 2.1 General

The NBC 1200 unit is designed to supply clean air to the citadel. The unit provides an amount of 1200 m³ cleaned air per hour. The unit is able to filter and de-contaminate the air during a NBC attack in a combat situation. During peace operation, the NBC 1200 unit can operate without the NBC filters to prevent saturation of these filters and maximize service life. The cleaned air from the NBC 1200 unit can be used directly or be treated in separate air handling units. The unit is able to supply air at a maximum overpressure of 500 Pa. This pressure can only be controlled by valves in the ships citadel. The unit is equipped with two outlets, which make Left Hand (LH) or Right Hand (RH) use possible. The NBC 1200 unit consists of the following main components:

Figure 2.1 Flow diagram

	End switch closed position	E.S.closed

June 2019 R19-127 2-1

# 2.2 Description of components of the NBC 1200 unit

# **2.2.1 Casing**

The NBC 1200 unit has a stainless steel casing which is mounted into the bulkhead. In the casing all components are mounted. The casing has several doors and hatches to get access to the following components inside the casing.

- · One door for access to the pre-filter and the fine filter.
- · One door to get access to the NBC filters.
- · One door to get access to the fan.
- · One door to get access to the control panel.
- One hatch to get access to the gastight valves and the heater.

The access doors to the pre- and fine filter, the NBC filters and the fan are equipped with end switches. These switches generate an alarm in the PLC when a door is opened during operation, and the unit is automatically switched off. When a door is open, the unit can not be started.

# 2.2.2 Water separator

Refer to item 1 on figure 2.1 and to divider 5 in section 9 of this manual.

The water separator is located at the inlet side of the unit. The water separator ensures that water (droplets) is removed from the air before entering the unit. The water separator drains off the water onto the deck.

#### 2.2.3 Blast valves

Refer to item 2 on figure 2.1 and to divider 6 in section 9 of this manual.

The blast valves are located on the inlet side of the unit behind the water separator. The blast valves protect the components in the unit against an overpressure situation as a result of a pressure wave after an explosion. The blast valve is a spring loaded valve which closes when pressure wave exceeds 6.5 kPa. When the blast valve is closed, the unit is isolated at the inlet side.

#### 2.2.4 Pre-filter

Refer to item 3 on figure 2.1 and to divider 7 in section 9 of this manual.

The pre-filter is located behind the blast valves. The pre-filter is a washable filter and filters the air on large particles. In this way the lifetime of the fine filter will be increased.

#### 2.2.5 Fine filter

Refer to item 4 on figure 2.1 and to divider 8 in section 9 of this manual.

The fine filter is located behind the pre-filter and filters the air from small particles. This filter increases the lifetime of the High Efficiency Particles (HEPA) part of the NBC filters. The fine filter is a non-washable filter which must be replaced when clogged.

#### 2.2.6 Electrical heater

Refer to item 5 on figure 2.1 and to divider 1 in section 9 of this manual.

The electrical heater is a heating element which is located behind the pre-filter, inside the unit. The electrical heater consist of one heating element. Dependent of the required heating capacity, the heater will be activated.

For the description of the control refer to 2.3.2 "Humidity control".

#### 2.2.7 Fan

Refer to item 8 on figure 2.1 and to divider 2 in section 9 of this manual.

The fan is a centrifugal type fan and takes care of an airflow through the unit, thus supplying the citadel with fresh, decontaminated air. The fan is suitable to supply 1200 m<sup>3</sup>/h air with an overpressure of 500 Pa in the citadel and a pressure loss of 500 Pa in the ducting to the citadel. The fan is directly driven by an electrical motor. The electrical motor is equipped with two sets of thermistors connected in serie. When one set fails, the other set of thermistors can be connected. To prevent overheat of the heating elements, the fan will stop after a cooldown period of 1 minute. During the cooldown period, the green pilot light "Fan on" will be flickering.

# 2.2.8 Gastight valve

Refer to item 7 and 10 on figure 2.1 and to divider 4 in section 9 of this manual.

The gastight valves are butterfly valves. The unit is equipped with three butterfly valves:

- By-pass valve (item 7),
- NBC valve air in (item 8),
- Main valve (item 11) (delivery third party).
- · NBC valve (air out (item 12).

The NBC valves can be used to block in the NBC filters. The lifetime of the NBC filters will be enlarged when there is no flow over the filters when they are not used.

The NBC valve air in is located downstream the fan and can be manually controlled.

The NBC valve air out is located downstream the NBC filters and can be manually controlled. The unit can only be started when the NBC valves are open and the By-pass valve is closed, or when the NBC valves are closed and the bypass valve is open. This is controlled by end-switches on the valve which give a signal of the open or closed position of the valve. When the unit is in operation, it will automatically be switched off when the end switch of the NBC valve is de-activated, due to turning of the handwheel.

The main valve can be used to isolate the unit from the ship's system.

The NBC valves and bypass valve are manually operated, with a handwheel. The main valve is motor operated.

# 2.2.9 Pressure differential indicators (Pdi)

All filters are equipped with pressure differential indicators. These pressure differential indicators indicate the pressure drop over the filter. When the pressure drop over a filter is too high, the filter is clogged and should be replaced.

The HEPA part of the NBC filter only is monitored by the differential pressure indicator. The carbon part of the NBC filters could be saturated with contamination while the pressure drop is still less than 1600 Pa.

All the filters should be replaced after an NBC challenge, disregarding the differential pressure.

June 2019 R19-127 2-3

# 2.2.10 Pressure differential switch (dPa)

The NBC filter is equipped with a pressure differential switch. When the pressure drop is lower than a set value the unit is switched off when running in NBC mode, also an alarm is generated. This alarm indicates that the filter is not, or not correct, installed.

#### 2.2.11 NBC filter

Refer to item 6 on figure 2.1 and to divider 9 in section 9 of this manual.

The NBC filters are according STANAG 4447. The NBC filters are located between the NBC valves. These filters will de-contaminate the air to the citadel, when the unit is running in NBC mode. The unit is equipped with four NBC filters. Each filter is able to de-contaminate 300m<sup>3</sup>/h. The filters are able to remove nuclear, biological and chemical warfare agents from the air. The inner part is the carbon section and the outer part in the HEPA section.

# 2.3 Description of the control system

#### 2.3.1 Fan control

In general the fan may only start at a safe situation. This means that first the main valve has to be in the open position, the NBC valves or the by-pass valve inside the unit must be in the open position and all doors must be closed. If one of the above conditions is not available or the thermal protection of the fan motor trips the fan will stop directly.

When the fan is stopped locally or remote, the fan will remain running for 1 minute to allow the heating elements to cool down.

# 2.3.2 Humidity control

To ensure an optimal efficiency of the NBC filters, the humidity of the air to the NBC filter may not exceed 60%. This is controlled by heating the incoming air by an electrical heater. This electrical heater heats up the air at least 10°C to ensure that the relative humidity does not exceed the given limit.

The electrical heater consist of one heating element. The required heating capacity is controlled by the PLC, by switching on or off the heater.

The heaters will heat up the temperature to max. 45°C.

The heater control is based on the outside and supply temperature. Depending on the outside temperature the set point for the supply temperature is determined. The heater is controlled with a thermostat and protected by the max heater thermostat.

- T outside lower 40° C
- T max heater 70° C

#### 2.3.2.1 Auto mode

In Auto mode, the heater elements are controlled by operating hours. The heating element with the highest operating hours will turn off first. At NBC loaded mode the heaters are running 5 steps;

- Step 1- select 0 : heaters off

Step 2 – T outside 40°c: heater on
Step 3 – T supply 45°c: heater off

#### 2.3.2.2 Manual mode

The heaters are limited to 45°c

Step 1 – select 0 : heater offStep 2 – select 1 : heater on

The heater is not released when;

- The fanmotor is not running
- Max temperature alarm active
- Stop (local/remote) is activated
- Emergency stop is activated
- Selection switch Off

#### 2.3.3 Valve control

Unit can run when pilot light (valve's in position) is illuminated:

- Main valve open
- Bypass valve open and NBC valves closed (pilot light) or
- Bypass valve closed (pilot light) and NBC valves open.

#### Unit stops when:

- Main valve not open (position closed or unknown and pilot light is flickering)
- Bypass valve not open or NBC valve not open

Unit cannot start when

- Main valve is closed (pilot light)
- Bypass valve and NBC valves are closed (pilot light)

# 2.3.4 Differential pressure control

Nbc filter is protected by a difference pressure switch. A low pressure is an indication of a missing filter. This check is done when:

- The unit is switched on
- The fan is running for at least 10 seconds.

A low differential pressure will result in a general alarm.

June 2019 R19-127 2-5

#### 2.3.5 Control modes

The NBC filter unit can operate in two different control modes:

- · Bypass mode
- NBC mode

#### 2.3.5.1 By-pass mode

In normal situation (not a combat situation), the unit is operating in by-pass mode. This means that the NBC filters are by-passed and the air is not decontaminated. By-pass mode is used to reduce the costs for NBC filters.

#### 2.3.5.2 NBC mode

In case of a possible NBC attack, the unit should be set to NBC mode. In NBC mode the NBC valve must be opened and the By-pass valve must be closed. When the NBC filters are installed correctly, an indication light on the unit will illuminate. When no NBC filters are installed in the unit, an alarm is generated in the PLC, due to a too low differential pressure over the filters. In this case, the unit will automatically be switched off.

# 2.3.6 Operation modes

The unit can be operated local and from the Central Monitoring System. By means of a selector switch local or remote operation can be selected. The control panel on the unit can only be used when the selector switch is set to local.

# 2.3.7 Control panel

#### 2.3.7.1 Electrical starter / control panel

The control, monitoring and automation items are intergrated in the electrical starter/control panel located on the upper backside of the unit. The panel power supply is provided by an external 440V/60Hz/3ph power supply (delivery third party).

For lay-out refer to paragraph 4.3.1": Lay-out Control panel"

After the main isolator the power supply is divided into the following groups, each with its own fuse:

- The fan motor
- · Electrical heater
- Power supply 440V/60Hz-24VDC

Each group can be made powerless by removing the respective fuses.

The 24VDC voltage for the control and monitoring installation is supplied by the above mentioned power supply, which consists of a transformer, a rectifier bridge, a condensator and a fuse.

The control, monitoring and automation functions are performed by a PLC (Programmable Logic Controller), to which all input signals are connected by means of digital input cards. The PLC software program continuously controls the state of the digital outputs as a result of the signal lamps and contactors controlling the fan and the heater elements. The PLC program is written be Van Halteren Special Products B.V. and can only be changed with special software.

For the electrical diagrams refer to 8.2.5": Electrical diagrams drawing no. 005-E-600".

#### Main circuits

On the control panel door the main isolator is located with which the complete unit can be made powerless. This switch "MAIN ISOLATOR" should normally be in the "1" (ON) position. A bus bar system acts as distribution for the main circuits.

#### Fan

The fan can be operated with the "START" and "STOP" buttons. The fan will only start if the relevant conditions are met, refer to paragraph 2.3.1 "Fan control".

#### Electric heater

With the selector switch "HEATER" with positions "O" (Off)", "1" (Auto), 2 (Manual) the heater can be controlled. If the selector switch is in position "O", the heater is switched off. In position "1", the heater is switched on continuously when the relevant conditions are met, refer to paragraph 2.3.2 "Humidity control".

In position "2", the heater is manually switched on

For the automatic control of the heater refer to paragraph 2.3.2 "Humidity control". For the heater, a green signal light indicates that the heater is switched on.

# 2.3.7.2 PLC hardware

The PLC consists of a rack, into which the following components are placed:

- The Central Processing Unit (CPU), that runs the PLC program. The CPU is the central control component of the PLC configuration which also consist of:
- · 4 digital input modules.
- · 2 digital output modules.
- 1 Analogue input module
- 1 Profibus module.

June 2019 R19-127 2-7

Heating capacity 4 kW
External static pressure 1000 Pa

# 3.6 Filtering efficiency

Pre-filter: G2 acc. EN 779
Fine filter: F8 acc. EN 779
NBC filter: acc. STANAG 4447

Separator: 100% for droplets > 13  $\mu$ m

# 3.7 Additional requirements

Vibrations: VDI 2056 class k ( $v_{eff} = 1.8 \text{ mm/s}$ )

Airborne noise Lw: 69 dB(A) (without distance attenuation) Unit

Shock: 56g vertical and 28g horizontal

EMC: The unit is designed to meet the requirements mentioned in

IEC 801-1 to4 and IEC 533.

Blast protection grade: 1 bar

# 4 Operation of the NBC 1200

# 4.1 Before operation

# 4.1.1 Storage

When the unit is stored for a long period of time the following precautions should be taken:

rotate impeller and motor once a month a few turns to prevent wear to bearings.

# 4.1.2 Hoisting

The unit may only be hoisted by lifting eyes at the top front side of the unit.

Make sure to use hoisting equipment with sufficient capacity.

For the weight of the unit refer to paragraph 3.2": General specifications".

# 4.2 Installation of the NBC 1200

# 4.2.1 Mounting instructions

For all positions refer to paragraph 8.2.3": Main assembly drawing no. 005-E-200".

1. Determine the position of the fixing bolts in the bulkhead by using the drilling jig which belongs to the series of units.

The unit has to be installed from the outside of the ship.

- 2. Remove the transport packaging.
- 3. Determine the position of the main valve and remove the blind flange position. Mind the gasket. Position 42,116.
- 4. Remove the fixing bolts of the support frame.
- 5. Lift the unit by using the two lifting eyes on the top front side of the unit.
- 6. Pull the unit inside and fix it with M10 bolts including washers and rings. Bolts, nut and washers to be used: type M10; stainless steel A4, class 80.
- 7. Connect the supply ducting including the main valve.
- 8. Remove the cable gland plate and gasket (pos. 45 and 102) and drill holes to apply the correct cable glands for the power cables and signal cables to IMPS.
- 9. Connect the power cable and the remote control cables to the unit. Refer to paragraph 8.2.5": Electrical diagrams drawing no. 005-E-600" page 10 & 18.
- 10. Remove the blind stop of the cable gland of the main valve and pull the electrical cable back into the panel. Apply the correct cable gland inner part.
- 11. Connect the signal cable to the main valve. Refer to paragraph 8.2.5": Electrical diagrams drawing no. 005-E-600" sheet 14.
- 12. Connect the power cable directly to the main valve.
- 13. Check if the "Open" and "Closed" indication of the main valve is working properly.

June 2019 R19-127 4-1

# 4.2.2 Air balancing

The unit has been designed for an external static pressure of 1000 Pa (500 Pa overpressure + 500 Pa duct resistance)

During air balancing of the total system in the ship each NBC filter unit has to be adjusted with a volume damper in the supply ducting.

The initial set-point: 1320 m<sup>3</sup>/hr. with clean filters.

The performance of the NBC filters will decrease when the airflow is higher than 10% of the nominal airflow of 1200 m<sup>3</sup>/hr.

# 4.3 Operation

# 4.3.1 Lay-out Control panel

Figure 4.1 Lay-out of control panel

No.	Action	Type of switch	Name plate	Default
10Q1	Main power on/off	Selector switch 0/1	Main isolator	1(ON)
11S1	Emergency stop	Push button	Emergency stop	N.A.
11S2	Reset emergency stop	Push button	Reset emergency stop	N.A.
13S1	Stop fan	Push button	STOP	N.A.
13S2	Operation mode	Selector switch L/R	NBC UNIT	R(emote)
13S3	Start fan	Push button	START	N.A.
13S4	Heater operation	Selector switch O/1/2	HEATER	1
13S5	Reset alarm	Push button (on/off)	Reset Alarm	N.A.

Table 4.1 Switches on control panel

No.	Name plate	Colour

Table 4.2 Signal lights on the control panel

No.	Name plate	Max. diff. pressure
17	PRE-FILTER	50 Pa
18	FINE-FILTER	150 Pa
19	CARBON-FILTER	1600 Pa

Table 4.3 Manometers

# 4.3.2 Out of operation

If the unit will be out of operation for a long period of time, switch off the main circuits and close both gas-tight valves to prevent saturation of the carbon filters. Refer to paragraph 4.1.1 "Storage" for instructions.

If the unit is stopped for a shorter period, switch off the heater and the fan.

All signal lamps will still function if the main isolator 10Q1 is still in the "1" position.

#### 4.3.3 Switch on the NBC 1200

#### 4.3.3.1 Start-up in NBC mode

Refer to Figure 4.1": Lay-out of control panel" for location of controls.

When the unit is started after a long period of time the starting condition of the fan should be tested after starting up. Refer to paragraph 2.3.1": Fan control"

- Check whether all filters are present and mounted correctly, refer to Figure 7.2": Filter replacement". Make sure the NBC filters are present in stead of the dummy filters. With the dummy filters the unit does not protect against an NBC challence
- 2. Check the unit visually for damage.
- 3. Set switch 13S2 on LOCAL. The unit can be operated with the control panel.
- 4. Make sure the main valve is open, (16L3) must be extinguished).
- 5. Make sure the "MAIN ISOLATOR" (10Q1) is in the "1" position.
- 6. Make sure if the NBC valves are in open position, the yellow signal lamp "NBC VALVE CLOSED" (16L2 and 16L9) must be extinguished.
- 7. Make sure the by-pass valve is closed, (16L1 must be on).
- 8. Make sure all valves are in position(16L7 must be on).
- 9. Push button (13S3) to switch on the fan.
- 10. Make sure the selector switch (13S4) is in the "1" position.
- 11. Check the differential pressure over the filters (refer to Table 4.3": Manometers").
- 12. Make sure all red indication lights are extinghuished.

When the NBC filters are not installed, the NBC 1200 does not supply filtered and decontaminated air.

#### 4.3.3.2 Start-up in by-pass mode

Refer to Figure 4.1": Lay-out of control panel" for location of controls.

When the unit is started after a long period of time the starting condition of the fan should be tested after starting up. Refer to paragraph 2.3.1": Fan control"

- 1. Check whether all filters are present and mounted correctly, refer to 7.5.2": Filter replacement". In by-pass mode or with dummy filters the unit does not protect against a NBC challence.
- 2. Check the unit visually for damage.
- 3. Set switch 13S2 on LOCAL. The unit can be operated with the control panel.
- 4. Make sure the main valve is open, (16L3) must be extinguished).
- 5. Make sure the "MAIN ISOLATOR" (10Q1) is in the "1" position.
- 6. Make sure if the NBC valves are in closed position, the yellow signal lamps "NBC VALVE CLOSED" (16L2 and 16L9) must be on.
- 7. Make sure the by-pass valve is in open position, the yellow signal lamp "BY-PASS VALVE CLOSED" (16L1) must be extinguished.
- 8. Push button (13S3) to switch on the fan.
- 9. Make sure the selector switch (13S4) is in the "1" position.
  - 10. Check the differential pressure over the filters (refer to Table 4.3": Manometers").

#### 4.3.4 Switch off the NBC unit

- 1. Push button (13S2) to switch off the fan. The fan will remain running for 1 minute if the heaters were switched on.
- 2. When the fan stops, set the main switch to the "0" position. All signal lights will extinguish.

#### 4.3.5 Emergency operation

The unit can be remote emergency stopped via the central monitoring and control system. When the unit is emergency stopped, the fan and the heater will be switched off.

# 5 Operating conditions and settings of safety devices

# 5.1 Settings

Do not change the settings of the safety control devices. This can cause damage to the unit or injury to personnel.

Refer to drawing 005-E-600 in section 8 of this manual for details

No.	Description	Setting
TA1	High temperature alarm heater	70 °C
TA2	Low temperature warning supply air	5°C
PA1	Low diff. pressure alarm NBC filter	900 Pa
10Q2	Thermal overload fan	4.6 Amp

Refer to 4.3.1": Lay-out Control panel" for location of manometers

No.	Description	Min. diff. pressure	Max. diff. pressure		
17	Differential pressure pre-filter	5 Pa	50 Pa		
18	Differential pressure fine filter	30 Pa	150 Pa		
19	Differential pressure NBC filters	±1150 Pa	1600 Pa		

The minimum differential pressure is the initial pressure drop over a clean filter.

Refer to drawing 005-E-600 in section 8 of this manual

No.	Description	Setting			
10HE1	Heater control step 1	+ 40 °C			

The heater control settings are set-points in the PLC, to switch on or off the heating elements.

Refer to drawing 005-E-600 in section 8 of this manual

No.	Description	Setting
10K1	Voltage	440V
10K1	U-max	484V
10K1	U-min	396V
10K1	Time	5 sec
10F13	I-nom	5,06 Amp

# 6 Trouble shooting

#### 6.1 Malfunctions

Refer to 2.1": General" and 4.3.1": Lay-out Control panel" for location of items.

#### 6.1.1 Fan does not start

Cause: no supply voltage.

Remedy: check supply voltage on X1:1, X1:2 and X1:3 (440VAC).

Cause: main isolator (10Q1) is in off position. Remedy: switch main isolator to on position "1".

Cause: unit emergency stopped.

Remedy: reset emergency stop on IMPS and press "RESET ALARM' button (13S5).

Cause: local remote selection not correct.

Remedy: check position of switch "LOCAL/REMOTE" (13S2).

Cause: valves not in position, signal lamp "VALVES IN POSITION" (16L7) not illuminated.

Remedy: check position of the NBC valves (8&12) and main valve valve (11).

Cause: main valve not open.
Remedy: open main valve (11).

Cause: loose wiring.

Remedy: check wiring of the fan (9).

Cause: fuse blown.

Remedy: check main circuit on short cut repair and replace fuses (10F1).

Cause: thermal overload protection activated.

Remedy: reset overload protection relay refer to paragraph 6.2.5": Thermal failure fan motor" .

Cause: alarm active.

Remedy: refer to paragraph 6.2 "Alarm indications".

# 6.1.2 Fan stopped

Cause: refer to paragraph 6.1.1 "Fan does not start". Remedy: refer to paragraph 6.1.1 "Fan does not start".

Cause: thermistor overheated.

Remedy: check setting thermal overload. Refer to paragraph 6.2.5 "Thermal failure fan

motor".

Reset: let motor cool down and start fan again.

June 2019 R19-127 6-1

# 6.1.3 Heater not working

Cause: fan not started.

Remedy: start fan refer to paragraph 4.3.3": Switch on the NBC 1200".

Cause: selector switch heater (13S5) in "O(ff)" position.

Remedy: put switch in "A(uto)" position.

Cause: fuses blown.

Remedy: check main circuit on short cut repair and replace fuses (10F4, 10F7 & 10F10).

Cause: alarm active.

Remedy: refer to paragraph 6.2 "Alarm indications".

#### 6.1.4 Main valve not working

Cause: local/remote selection not correct.
Remedy: put switch in correct position.

Cause: unit emergency stopped.

Remedy: reset emergency stop on IMCS and press "RESET ALARM".

# 6.2 Alarm indications

An alarm will be indicated by an illuminated signal light on the control panel. The name plate underneath the signal light describes the meaning of the signal light.

# 6.2.1 Panel door open

Cause: one of the doors is not fully closed.

Remedy: check and close panel doors. Refer to paragraph 2.2.1": Casing".

Reset: push button "RESET ALARM".

# 6.2.2 Maximum temperature alarm heater

Cause: heater manual operated at high temperatures.

Remedy: put heater selector switch (13S4) on "A(uto)" or "O(ff)".

Cause: no sufficient airflow.

Remedy: check unit and supply duct for obstructions.

Cause: not correct setting of maximum temperature.

Remedy: check setting (70°C) in software.

Reset: push button "RESET ALARM".

# 6.2.3 Minimum air temperature

Cause: heater not working.

Remedy: refer to paragraph 6.1.3 "Heater not working".

Cause: extreme cold outside temperature.

Remedy: none.

Cause: not correct setting in software.

Remedy: check setting in software.

Reset: automatically when temperature in range.

# 6.2.4 Low pressure NBC filter

Cause: filters not loaded.

Remedy: place filters, refer to paragraph 7.4.1": Filter replacement".

Cause: not correct position of the valves.

Remedy: check if position equals with the required mode, refer to

paragraph 4.3.3": Switch on the NBC 1200".

Cause: incorrect setting of the pressostat.

Remedy: check set-point of the pressostat (dPa-CO-L).

Cause: NBC filters not correct mounted.

Remedy: check the positioning of the NBC filters, refer to

paragraph 7.4.1": Filter replacement".

Cause: press-on mechanism not placed.

Remedy: check if press-on mechanism is placed, refer to

paragraph 7.4.1": Filter replacement".

Reset: push button "RESET ALARM".

#### 6.2.5 Thermal failure fan motor

Cause: loose wiring.

Remedy: check wiring in the main circuit of the fan.

Cause: airflow obstructed.

Remedy: check the unit and supply duct for obstructions.

Cause: setting thermal overload not correct.

Remedy: check setting of thermal overload relais 10F13 (4,6 Amp).

Located inside control panel

Reset: on thermal overload relais (10F13) and push button "RESET ALARM" (13S5).

June 2019 R19-127 6-3

# 7 Maintenance

#### 7.1 General

This NBC 1200 is designed to be operational with a minimum of maintenance. However, to ensure a save and reliable operation, some preventive maintenance should be performed to the unit. Performing the preventive maintenance tasks conscientiously, will reduce possible malfunctioning of the unit. Refer to paragraph 7.3 "Preventive maintenance" for the preventive maintenance plan.

The HEPA part of the NBC filter only is monitored by the differential pressure indicator. The carbon part of the NBC filters could be saturated with contamination while the pressure drop is still less than 1600 Pa.

All the filters should be replaced after a NBC challenge, disregarding the differential pressure.

Maintenance tasks may only be performed by suitable trained personnel. Maintenance on the electrical components of the NBC 1200 should be executed by an electrical service engineer. Maintenance on the mechanical components of the NBC 1200 should be executed by a mechanical service engineer.

# 7.2 Maintenance after a NBC challenge

The following maintenance task should be performed after a NBC challenge

- Replace the pre-filter refer to paragraph 7.4.1.1 "Clean or replace the pre-filter".
- Replace the fine filter refer to paragraph 7.4.1.2": Replace the fine filter".
- Replace the NBC filters refer to paragraph 7.4.1.3 "Replace the NBC filters".
- · Back home: have the units cleaned by experts.

New NBC filters should always be installed when the units are not yet cleaned by experts.

#### 7.3 Preventive maintenance

This paragraph gives an overview of the preventive maintenance tasks, divided into intervals. The maintenance tasks are not only dependent on the given interval, but also on the actual running hours of the components (i.e. filters or fan).

Task	Level	Frequency	Time estimate	Skill of personnel	Required spec. tools	Ref.	Remarks
Run unit with heater on	Shipboard	Monthly	15 min.	Mechanic		4.3.3	
Check motor for noise and vibration	Shipboard	Monthly	5 min.	Mechanic		7.3.1	Replace bearings when required

Task	Level	Frequency	Time estimate	Skill of personnel	Required spec. tools	Ref.	Remarks
Check differential pressure pre-filter	Shipboard	Monthly	2 min.	Mechanic		7.3.1	Replace filter when required
Check differential pressure fine-filter	Shipboard	Monthly	2 min.	Mechanic		7.3.1	Replace filter when required
Check differential pressure NBC-filter	Shipboard	Monthly	2 min.	Mechanic		7.3.1	Replace filters when required
Check operation of control panel	Shipboard	Quarterly	20 min.	Mechanic		7.3.2	
Check flexible con- nections for cracks	Shipboard	Quarterly	15 min.	Mechanic		7.3.2	Replace if damaged
Check shock mounts for damage	Shipboard	Quarterly	15 min.	Mechanic		7.3.2	Replace if damaged
Check the unit for loose bolts, nuts and connections	Shipboard	Quarterly	1 hours	Mechanic		7.3.2	Fasten when required
Check unit and control panel for loose electrical connections	Shipboard	Quarterly	1 hour	Electrician		7.3.2	Fasten when required
Replace battery of PLC	Base	Annual	5 min	Electrician		7.3.3	
Measure current of heater elements	Base	Annual	30 min	Electrician		7.3.3	
Inspect and clean heater	Base	Annual	30 min	Mechanic	Brush and vac- uum cleaner	7.3.3	Only clean if required
Clean impeller	Base	Annual	20 min	Mechanic	Brush and vac- uum cleaner	7.3.3	Only clean if required
Check for corrosion	Base	Annual	20 min	Mechanic		7.3.3	Tough up if required
Inspect and clean blast valve	Base	Annual	20 min	Mechanic	Brush and compressed air	7.3.3	Only clean if required
Grease hinges of fil- ter doors	Base	Annual	5 min	Mechanic	Grease gun	7.3.3	

Table 7.1 Overview preventive maintenance tasks

# 7.3.1 Overview monthly maintenance

The following maintenance tasks should be performed each month.

- Run the unit monthly at least for a quarter of a hour with the heater switched on.
- Inspect the motor and fan for unusual noise (to detect worn bearings).
- Check the differential pressure over the pre-filter (to detect clogging of filter). Clean or replace filter when the differential pressure exceeds 50 Pa. Refer to paragraph 7.4.1.1 "Clean or replace the pre-filter".
- Check the differential pressure over the fine-filter (to detect clogging of filter). Replace filter when the differential pressure exceeds 150 Pa. Refer to paragraph 7.4.1.2": Replace the fine filter".
- Check the differential pressure over the carbon (NBC) filter (if filters installed). Replace filters
  when the differential pressure exceeds 1600 Pa. Refer to paragraph 7.4.1.3 "Replace the NBC
  filters".

The HEPA part of the NBC filter only is monitored by the differential pressure indicator. The carbon part of the NBC filters could be saturated with contamination while the pressure drop is still less than 1600 Pa.

All the filters should be replaced after a NBC challenge, disregarding the differential pressure.

During monthly maintenance, the unit is available for operation.

The monthly maintenance tasks can be performed as first level maintenance.

No test and service equipment or special tools are required to perform the monthly maintenance tasks.

No spare parts are required to perform the monthly maintenance tasks.

# 7.3.2 Quarterly maintenance

The following maintenance tasks should be performed each three months:

- Check the operation of the control panel (switches, control keys and lights).
- · Check flexible connection for cracks.
- · Check the shock mounts for damage.
- Visual inspect the tube connections inside the unit.
- · Visual inspect the unit for loose bolts and nuts.

Shut-off the electrical supply before you open the control panel. The equipment in the control panel carry high voltages.

· Visually inspect the electrical connections internally in the unit and control panel.

During quarterly maintenance, the unit is not available for operation.

The quarterly maintenance tasks can be performed as first level maintenance, by an authorised electrical service engineer.

No test and service equipment or special tools are required to perform the quarterly maintenance tasks.

No spare parts are required to perform the quarterly maintenance tasks.

#### 7.3.3 Annual maintenance

The following maintenance tasks should be performed each year:

- Replace the battery of the PLC, refer to paragraph 7.4.2 "Replace the battery of the PLC".
- Measure the nominal current of the heater elements. For the currents refer to paragraph 8.2.5": Electrical diagrams drawing no. 005-E-600" accuracy ± 0.3 A.
- Visually inspect the heater and clean the elements if necessary with a brush and a vacuum cleaner.
- · Check unit visually for corrosion and signs of water at the inside of theunit.
- · Clean the impeller of the fan with a brush and a vacuum cleaner.
- · Tough up damaged paint.

Use safety glasses when you work with pressurised air.

Visual inspect the blast valve and clean it with pressurised air.

Obey the safety instructions of the manufacturer when you work with grease.

 Re-grease the hinges of the fan door, pre- and fine filter door, NBC filter door with aqua-geargrease.

During annual maintenance, the unit is not available for operation, except for the paint repair work. All annual maintenance tasks can be perform as first level maintenance.

June 2019 R19-127 7-3

#### 7.4 General maintenance

This paragraph describes the general maintenance tasks which must be performed during repairs or replacement of components, or maintenance tasks which must be performed due to deviations found during preventive maintenance.

# 7.4.1 Filter replacement

Figure 7.1 Filter replacement

# 7.4.1.1 Clean or replace the pre-filter

This paragraph gives the procedure for cleaning or removal of the pre-filter and installation of a new pre-filter, including the necessary precautions for removal of a contaminated pre-filter. If the pre-filter is NOT contaminated it can be cleaned with water and re-used.

Refer to Figure 7.1 "Filter replacement" for location of filter.

All the filters should be replaced after a NBC challenge, disregarding the differential pressure.

If the pre-filter is contaminated, the filter should be disposed according Naval regulations.

Make sure you will take the necessary personal precautions when replacing a filter after a NBC attack.

- 1. Stop the unit.
- 2. Open the door to get access to the pre-filter.
- 3. Remove the pre-filter.
- 4. Clean the filter with clear water (a detergent could be added).
- 5. Wash the filter with clear water if a detergent has been used.
- 6. Dispose the filter according the Naval regulations if it is contaminated.

Check the flow direction of the filter before you put the filter in place. This is indicated by an arrow on the filter. The arrow must point outwards.

- 7. Put the cleaned or new pre-filter in place. Make sure all packaging material is removed from the filter
- 8. Close the access door.
- 9. Start the unit.
- 10. Check the differential pressure over the pre-filter to make sure the filter is installed correctly.

During the replacement of the filter, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task

LCRS Item nr.	Item name	NSN	Qty
1	Pre-filter		1

#### 7.4.1.2 Replace the fine filter

This paragraph gives the procedure for removal of a fine filter and installation of a new fine filter, including the necessary precautions for removal of a contaminated fine filter.

Refer to Figure 7.1 "Filter replacement" for location of filter.

All the filters should be replaced after a NBC challenge, disregarding the differential pressure.

Make sure you will take the necessary personal precautions when replacing a filter after a NBC attack

If the fine filter is contaminated the filter should be disposed according Naval regulations.

- 1. Switch off the unit.
- 2. Open the door to get access to the fine filter.
- 3. Loosen the press-on mechanism of the fine filter.
- 4. Remove the fine filter.
- 5. Dispose the filter according the Naval regulations.

Check the flow direction of the filter before you put the filter in place. This is indicated by an arrow on the filter. The arrow must point outwards.

- 6. Put the new fine filter in place. Make sure all packaging material is removed from the filter.
- 7. Tighten the press-on mechanism of the fine filter.
- 8. Close the door.
- 9. Switch on the unit.
- 10. Check the differential pressure over the fine filter on the control panel, to make sure the filter is installed correctly.

During the replacement of the filter, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task

LCRS Item nr.	Item name	NSN	Qty
2	Fine filter		1

#### 7.4.1.3 Replace the NBC filters

This paragraph gives the procedure for removal of a contaminated filter and installation of new NBC filters, including the necessary precautions for removal of contaminated filters.

Refer to Figure 7.1 "Filter replacement" for location of filters.

All the filters should be replaced after a NBC challenge, disregarding the differential pressure.

Make sure you will take the necessary personal precautions when replacing a filter after a NBC attack.

If the NBC filters are contaminated the filters should be disposed according Naval regulations.

Handle contaminated filters carefully while contaminated dust could fall into the clean part of the unit.

- 1. Switch off the unit.
- 2. Open the door to get access to the NBC filters.
- 3. Loosen the NBC filter hatch.
- 4. Remove the NBC filters carefully.
- 5. Dispose the filters according the Naval regulations.
- 6. Put the new NBC filters in place. Make sure all packaging material is removed from the filters.
- 7. Remount the NBC filter hatch.
- 8. Close the NBC door.
- 9. Switch on the unit.
- 10. Check the differential pressure over the NBC filters on the control panel, to make sure the filters are installed correctly.

During the replacement of the filters, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task:

LCRS Item nr.	Item name	NSN	Qty
3	NBC filter		4

### 7.4.2 Replace the battery of the PLC

To prevent malfunctioning of the PLC, the battery of the PLC should be replaced annually.

If you wait too long to replace a discharged battery, the memory in the PLC can be lost.

Do the following to replace the battery:

Shut of the electrical supply before you open the control panel. The equipment in the control panel carries high voltage.

- 1. Set the main switch of the control panel to OFF.
- 2. Open the door of the control panel.
- 3. Remove the cover at the right side of the PLC.
- 4. Remove the battery from the battery holder.
- 5. Install a new battery in the battery holder.
- 6. Place the cover.
- 7. Set the main switch to "ON", the unit is ready for use.

Dispose the battery on an environmental friendly way.

During the replacement of the battery, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task:

LCRS Item nr.	Item name	NSN	Qty
	Battery 3V Lithium		1

### 7.4.3 Replace the differential pressure switch

Do the following to replace the differential pressure switch:

Shut of the electrical supply before you open the control panel. The equipment in the control panel carries high voltage.

- 1. Set the main switch of the control panel to OFF.
- 2. Open the control panel door to get access to the switch.
- 3. Disconnect the hoses from the switch.
- 4. Disconnect the electrical wiring from the switch. Mark the electrical connections. This will help you during installation.
- 5. Remove the mounting materials and remove the switch from the unit.
- 6. Install the new switch with the mounting materials in the unit.
- 7. Connect the electrical wiring according the marks.

- 8. Connect the hoses to the switch.
- 9. Set the cut-off pressure on the numeric scale indicator by adjusting the screw. Refer to section 5.1 for the correct setting (PA1).
- 10. Close the door.
- 11. Set the main switch to ON position.

During the replacement of the switch, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task:

LCRS Item nr.	Item name	NSN	Qty
30	Differential pressure switch		1

### 7.4.4 Replace the 3 phase safety relay

Do the following to replace the 3 phase safety relay:

Shut of the electrical supply before you open the control panel. The equipment in the control panel carries high voltage.

- 1. Set the main switch of the control panel to OFF.
- 2. Open the control panel door to get access to the relay.
- 3. Disconnect the electrical wiring from the switch. Mark the electrical connections. This will help you during installation.
- 4. Remove the relay from the DIN rail.
- 5. Install the new relay onto the DIN rail.
- 6. Connect the electrical wiring according the marks.
- 7. Set the main switch to ON position.
- 8. Adjust the relay by incorporating the correct settings. Refer to section 5.1 for the correct setting (10K1).
- 9. Close the door.

During the replacement of the relay, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task:

LCRS Item nr.	Item name	NSN	Qty
40	3 phase safety relay		1

### 7.4.5 Replace the thermal protection relay

Do the following to replace the thermal protection relay:

Shut of the electrical supply before you open the control panel. The equipment in the control panel carries high voltage.

- 1. Set the main switch of the control panel to OFF.
- 2. Open the control panel door to get access to the relay.
- 3. Disconnect the electrical wiring from the switch. Mark the electrical connections. This will help you during installation.
- 4. Remove the relay from the DIN rail.
- 5. Install the new relay onto the DIN rail.
- 6. Connect the electrical wiring according the marks.
- 7. Set the main switch to ON position.
- 8. Adjust the relay by incorporating the correct setting. Refer to section 5.1 for the correct setting (10F13).
- 9. Close the door.

During the replacement of the relay, the unit is not available.

No special tools are required to perform this maintenance task.

The following spare part is required to perform the maintenance task:

LCRS Item nr.	Item name	NSN	Qty
41	Thermal protection relay		1

# 8 Drawings, listings and logbook

### 8.1 Logbook

#### 8.1.1 General

For adequate maintenance management a log-book should be maintained.

A log-book comprises:

- · all inspections;
- · all executed repairs and replacements of components;
- particular events like:
  - · deviations from the normal management/operation;
  - · dangerous situations;

### 8.1.2 Periodical inspections

Records of periodical inspections could contain:

- · what periodical inspections should be carried out;
- · the executor who should carry out these inspections;
- the time interval between which the inspections should be carried out;
- · persons who should be informed about these inspections.

Sheet 8.1.1 is an example of a sheet to be used for recording periodical inspections.

### 8.1.3 Repair and maintenance

Repairs should only be carried out by skilled personnel and after permission of the management. Repairs and maintenance should be carried out by more than one person.

Each repair and case of maintenance should be recorded in the log-book.

Sheet 8.1.2 is an example of a sheet to be used for recording repairs and cases of maintenance.

### 8.1.4 Replacement of components and revision of installation

Revisions and replacement of components should be recorded in the log-book. Sheet 8.1.3 is an example of a sheet to be used for recording revisions and replacement of components.

#### 8.1.5 Particular events

Faults, accidents, deviations of normal management and other particular events should be recorded in the log-book.

Sheet 8.1.4 is an example of a sheet to be used for recording particular events.
